Wool passes through more processes than any other primary product.

Even wool needs oiling!

Australia is the world's chief source of wool, although 8 per cent. of the clip is retained each year for home manufacture.

There has been great expansion in the output of woollen goods from mills in Australia in recent years.

The value of hosiery and other knitted garments has risen from about £8 million in 1939 to more than £45½ million in 1953-54, and is still increasing.

Before reaching the public, wool passes through more processes than any other primary product. These include scouring, carbonising, dyeing, carding, combing, spinning and weaving.

Natural Oils Replaced. Much of the

natural oil is lost in scouring. This must be replaced before spinning.

Vegetable oils were used until World War II when, because of shortages, an alternative had to be found.

Shell scientists in Australian laboratories began research to find an oil which would be suitable for the combing and spinning of worsteds. They achieved their objective in a mineral oil* derived from petroleum. Today, large quantities of the oil used in Australian woollen mills is of mineral origin.

This is another instance of SHELL helping to develop Australia's great manufacturing industries.
